

## *“pH CONTROLS SPECIES”*

When we change our life sustaining medium (the air that we breathe, the water we drink and the land we cultivate) we will eventually evolve into a separate species.

Awareness of this environmental muse is important for sustaining human life on earth.

The idea that current use of nonrenewable finite resources (i.e. fossil fuels & forest) has the potential to change the pH of water, arable land and air will be debated, as life , as we know it changes inexorably.

Ecowalla Enzyme Cleaner is one commodity that seeks to slow down fluctuation of pH change by encouraging the use of pH neutral products in daily chores like household cleaning. pH neutral waste water will not harm the flora or fauna of water courses like rivers or estuaries

Use pH neutral products to slow down and/or stop species change. It starts with us.
